Outlook is Weak

The U.S. Consumer is getting hit from all sides…

…current unemployment is structurally weak…

…both working to drag down U.S. and Global GDP.

Since 1920, US household debt has increased dramatically

1920 Average Annual Savings: **$1,232**

1920 Average Household Debt: **$4,368**

2008 Average Annual Savings: **$392**

2008 Average Household Debt: **$117,951**

Note: All figures in 2008 dollars.
Technology spending has outpaced the rest of the economy

- LTM Total Industrial Production growth: **-1.5%**
- LTM Industrial Production growth, excluding Technology(a): **-3.5%**

Source: Goldman Sachs, Federal Reserve Board
(a) Technology includes computers and peripherals, communication equipment and semiconductor and related equipment
The Technology Economy

Technology growth expected to continue

Technology Phases

The Internet has already helped drive efficiencies in the economy; New technologies are poised to deliver additional gains

Phase I: Personal Computers and Software

PC and software growth represented the first phase of the new tech economy

Phase II: The Emergence of the Internet

Most recently, significant value has been extracted from the proliferation of the internet

Phase III: Mobility and Broadband

Mobility and broadband will deliver the next wave of IT-induced productivity growth

Source: The Information Technology & Innovation Foundation, June 2007; Gartner estimates
Major Industry Trends – Software

We’ve reached the end of modern software history

• Traditional Desktop software development is reaching the end of its life…the center of development has shifted to web-based paradigms

• “Open Source” may increasingly become the model for many companies delivering traditional software development environments and infrastructure components

• SaaS, and now PaaS offerings, will accelerate price deflation

The future will not look like the past
Major Industry Trends – Hardware

*Asian supply chains rule*

- Moore’s law remains unbroken but more expensive than ever
- Return of vertical integration for hardware market leaders (HP, IBM, Samsung)
- Rise of NAND flash
- Emergence of national champions

Source: Intel 2008 Investor Meeting presentation “Return on Innovation”
Major Industry Trends – Services

**IT systems don’t install or maintain themselves**

Industry EBIT and EBIT Margin Since 1998
(US Only)

- Largest single sector, over $540 bn in revenues
- Experiencing uneven commoditization
- Standardized work continues moving to low-cost geographies
- Acceleration of M&A activity now inevitable

Note: EBIT chart based on ACS, BearingPoint, CSC, EDS, and Unisys
Source: Filings; Wall Street research
Major Industry Trends – Networking / Communications

**Bandwidth boom driving the need for improved wireline infrastructure and next-gen wireless networks**

- Consumers are causing exponential growth in Internet traffic, driven by many new applications with more video content

- Business video use lags as bandwidth tariffing/pricing models differ from consumer; business use is expected to explode in the next 3 years

- Watch for dramatic increases in wireline and next-gen wireless network infrastructure spending as traditional carrier business models come under attack

- Scale vendors will benefit disproportionately from this new infrastructure investment

- Convergence at the enterprise is creating a new $44 bn market for “Unified Communications” (including HD collaboration) and setting the stage for a competition between equipment providers, software incumbents, apps vendors and services providers
Consumer Internet Traffic

*Internet traffic and bandwidth requirements are exploding – the Internet is expected to quadruple in size in the next four years, primarily driven by video*

Question?

Over the last 15 years which technology resource has improved most in terms of price/performance?

<table>

In every era, the winning companies are those that waste what is abundant – as signaled by sharply declining prices – in order to save what is scarce

- US auto companies profited through the 50s and 60s on the backs of abundant (and cheap) gasoline and road building

- Microsoft exploited the economics of the PC revolution as no other – engineering more and more functionality onto an ever improving price performance curve for processors and local storage

- Google, in turn, has been extravagant about using data storage and backbone bandwidth. Conversely, it has been economical with today’s most precious resource, users’ time & patience

- AVI-SPL…
